

Cloud-based web access security service

Zscaler with KDDI

The world's largest security cloud

- Supports a variety of communications environments

Allows central security management for multi-device environments. A single security policy can be applied to devices being used both in and out of the office. Plus, no matter where you connect from, your connection uses the nearest optimal connection node, cutting distance lag.

- Protects against increasingly advanced and complex attacks

The layered-security provides protection against even "zero-day" attacks, allowing users to safely use the Internet. Restrictions can be placed on posting to SNSes or message boards or using data storage services, as these are risks for data leaks.

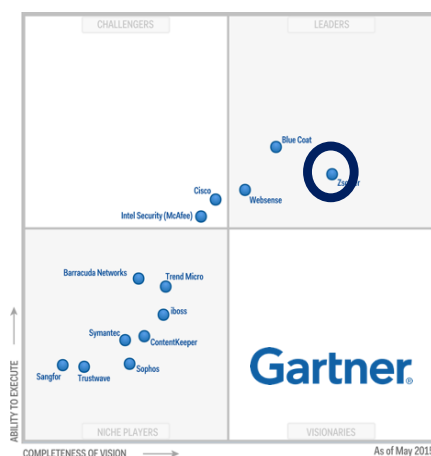

- Contributes to IT cost reduction and optimization

Thanks to being a cloud service, Zscaler with KDDI can provide global, secure Internet access at a low price. Uniform, centrally-managed security policies can reduce your operating costs.

A leading reputation in the security market

The SC Awards' Winner (2016)
— Best Cloud Computing Security.

For the sixth consecutive year
Zscaler is named leader in the 2016
Gartner Magic Quadrant for Secure
Web Gateways.

Get on board! Zscaler a leader in
the Forrester Wave.

Zscaler makes the most of the benefits of being a cloud service, supporting a wide variety of devices and network environments.

With information security now being a top management concern

KDDI is your global security partner

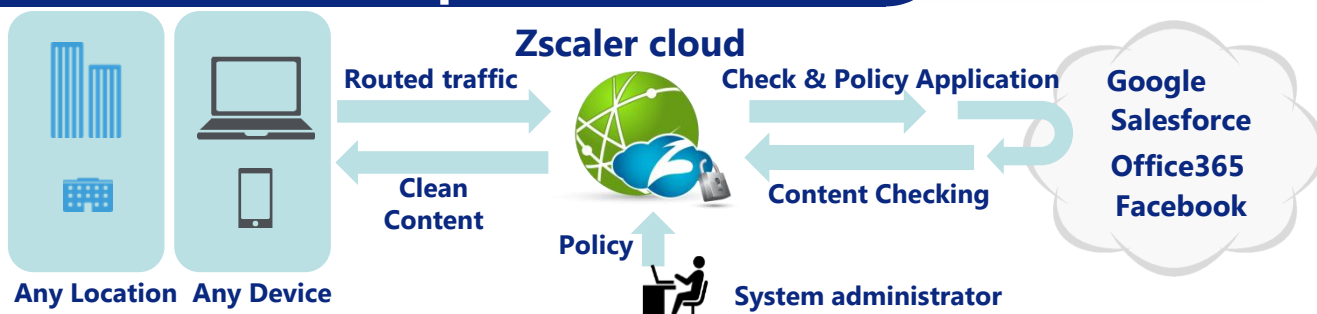

A total ICT solution provided by the KDDI group worldwide

We have business presence in **63 cities** around the world, with **114 offices**

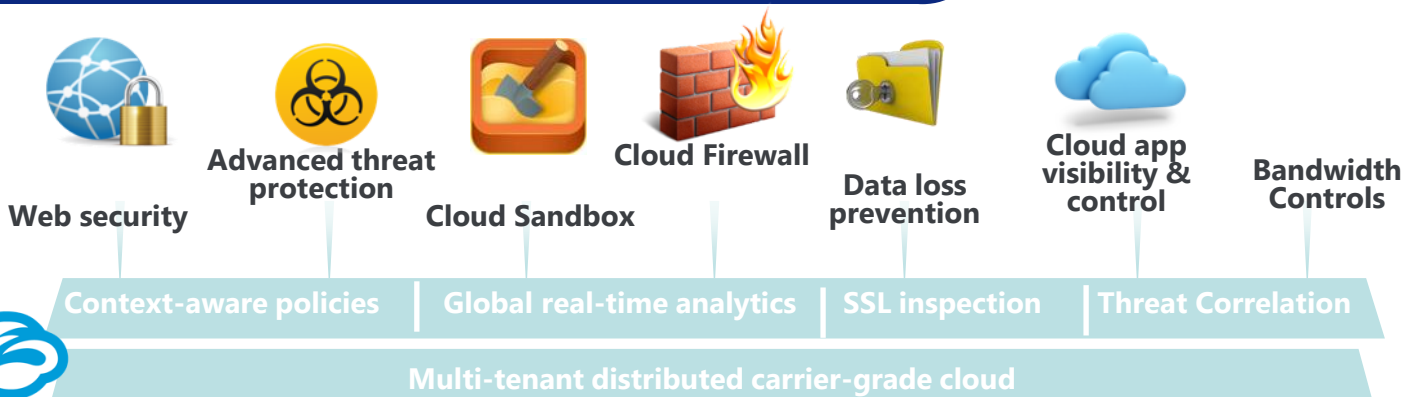

With over **5,700 staff** world-wide, we will work to help you with your global business.

Visualization of product use

Secure Internet access without the need to buy and set up equipment. Free your IT staff from the hassles of appliance management.

Multi-layered security

World's largest security cloud

- Award-winning security platform with 100+ data centers and near-zero latency.
- Access to all connection nodes for all users.
- Policy control over all your users' connections.

Cloud Security Platform
